checkpoint. They have demonstrated their efficacy and safety in the treatment of different solid tumours.

Purpose To evaluate the incidence of adverse events (AE) associated with immune checkpoint inhibitors and to analyse the management of the toxicity.

Material and methods Descriptive and retrospective study which included every patient treated with Nivolumab or Pembrolizumab between April 2015 and September 2018 in a third-level hospital. Demographics and clinical variables were collected from the electronic medical records: sex, age, type of tumour, number of cycles, causes of treatment suspension, AE and its severity, as well the need for referral to other specialist, pharmacological treatment or hospitalisation for its handling.

Results We included 71 patients (74.6% males), 60.6% were treated with Nivolumab and 39.4% with Pembrolizumab. Average age was 67.6 years (SD 10.3) and the median number of cycles was eight (1–70). The most frequent types of tumours were non-small-cell lung cancer (63.0%), bladder cancer (15.1%) and renal cancer (8.2%).

74.7% of patients presented >1 AE, all immunomediated: 79.1% with Nivolumab (8.9% grade 3) and 71.4% with Pembrolizumab (22.5% grade 3). The most common AE in both groups were asthenia (53.5% with Nivolumab and 32.1% with Pembrolizumab), skin toxicity (37.2% and 25% respectively) and diarrhoea (14% and 21.4% respectively). Immune-mediated toxicity was the cause of permanent treatment suspension in 15.1% of patients (45.5% hepatitis and 18.2% pneumonitis).

Referral to other specialists was necessary in 20.9% of patients treated with Nivolumab and 25% with Pembrolizumab. 32.6% of patients with Nivolumab and 39.3% with Pembrolizumab required pharmacological management. Also, 7% of cases required hospitalisation to control AE due to Nivolumab and 25% due to Pembrolizumab.

Conclusion All treatment-related AE are immune-mediated. Despite being less frequent, there are certain AE which, due to their clinical relevance, led to the permanent suspension of treatment. The incidence of grade 3 EA was higher in patients treated with Pembrolizumab, as well as hospitalisation required. The role of a multidisciplinary team is essential in handling possible related EA, achieving an adequate treatment optimisation.

5PSQ-067 DETECTION OF ADVERSE NEUROPSYCHIATRIC REACTIONS ASSOCIATED WITH ABIRATERONE AND ENZALUTAMIDE TREATMENTS IN THE HOSPITAL

¹AM Valle Díaz de La Guardia, ²R Álvarez Sánchez*, ¹A Jiménez, ¹E González. ¹Hospital Universitario Virgen de Las Nieves, Farmacia Hospitalaria, Granada, Spain; ²Hospital Universitario San Cecilio, Farmacia Hospitalaria, Granada, Spain

10.1136/ejhp-2019-eahpconf.500

Background Enzalutamide (ENZ) and abiraterone acetate (AA) are oral treatments indicated for metastatic castration-resistant prostate cancer (mCPRC). Both drugs can cause neurological and psychiatric adverse effects. Some publications suggest that some neuropsychiatric adverse reactions are more frequent with ENZ than with AA.

Purpose The aim of this study was to check the prevalence of these types of adverse reactions in patients treated in our hospital, by reviewing their clinical history.

Material and methods We selected those patients in treatment with ENZ or with AA in our hospital from January 2015 to September 2018. Clinical data were obtained by consulting their clinical history and the pharmacy service's computer program. The presence of any of these signs/symptoms was identified as adverse neuropsychiatric reaction: restless leg syndrome, anxiety, headache, insomnia, seizures, falls, dizziness, hallucinations, memory impairment.

Results During the study period, 53 patients received treatment with abiraterone and 61 patients received treatment with enzalutamide. The mean age was over 60 years in both groups. In the AA group, 12 patients (22.6%) with adverse neuropsychiatric-type reactions were detected: falls (eight patients), insomnia (six patients), headache (six patients) and memory loss (four patients). The ENZ group showed similar data, in 14 patients these types of alterations appeared (22.9%): insomnia (10 patients), headache (six patients), falls (six patients) and memory loss (five patients).

Conclusion After evaluating our results, it could be concluded that both abiraterone and enzalutamide show the same profile in terms of adverse neuropsychiatric reactions. But it is true that more studies are required to determine if these reactions are due to these drugs or to other factors such as age, the evolution of the disease or the patient's social situation.

5PSQ-068 ADHERENCE TO DISEASE-MODIFYING THERAPIES IN SPANISH PATIENTS WITH MULTIPLE SCLEROSIS

¹E Ramírez Herráiz*, ²R Morillo Verdugo, ³R Fernández-del Olmo, ⁴M Roig Bonet, ⁵M Valdivia García. ¹Hospital Universitario de La Princesa, Farmacia Hospitalaria, Madrid, Spain; ²Hospital Universitario de Valme, Farmacia Hospitalaria, Sevilla, Spain; ³Roche, Market Access, Madrid, Spain; ⁴Fundación, Projects and Innovation, Barcelona, Spain; ⁵Fundación, Health Area, Madrid, Spain

10.1136/ejhp-2019-eahpconf.501

Background Like in other chronic diseases, the adherence to disease-modifying treatments in multiple sclerosis (MS) is essential to maximise its efficacy. The adherence is relevant for the symptoms' relief and delay in disease progression. It is essential to find out factors which could influence adherence rates in MS patients, in order to improve the management of the disease.

Purpose This study aims to evaluate the adherence to MS treatment in Spanish patients and find out variables that may influence it.

Material and methods Cross-sectional study conducted in MS Spanish patients receiving disease-modifying treatments ≥1 year before the inclusion. The recruitment was performed in hospitals and patients' associations by healthcare professionals and patient association's staff. Adherence was measured using the Morisky–Green scale (four questions with dichotomous answers, compliance was considered with these answers: NO/YES/NO/NO) and related factors using a questionnaire addressing demographic/disease characteristics, global perception of pathology, impact of medication on patient life,

administration route (oral/injectable/intravenous), treatment satisfaction and treatment decision-making. This questionnaire was elaborated and validated by an MS expert committee (hospital pharmacists, neurologist, patients' associations: Fundación Esclerosis Múltiple Madrid (nurses) and Esclerosis Múltiple España (clinical psychologists).

Results One-hundred and fifty-seven MS patients (44 males/113 females) were included. The adherence rate was 71% (Morisky–Green scale), and was associated with: older age (mean: 45.2 years compliance; 40.4 years non-compliance), better cognitive status, being married/in-union, more lines of prior treatments, time to diagnosis of 5–10 years, exacerbations absence, clear information about the disease and high treatment satisfaction (table). There were no differences in the adherence rate between oral (63%) and injectable (77%) treatments. Analysing the injectable administration, there was greater adherence in patients with IV (100%) vs SC (68%). There was also a significant difference between IV (100%) vs oral (63%) ($p=0.001$). The main cause for non-compliance was forgetfulness (27%).

Conclusion Adherence rate for the MS treatment is acceptable (71%). It is negatively affected by forgetfulness, lower cognitive status and lack of family support. The injectable route shows higher adherence than the oral route, although the latter show the highest patient satisfaction.

5PSQ-069 ABSTRACT WITHDRAWN

5PSQ-070 INFLUENCE OF PATHOLOGY IN INJECTION PAIN REDUCTION WITH A NEW FORMULATION OF ORIGINAL ADALIMUMAB

¹J Martínez-Casanova, ¹P Acín*, ¹N Carballo, ¹R Gonzalez, ¹E Navarrete Rouco, ²C Perez García, ¹E Gonzalez-Colominas, ¹L Tarason, ¹S Grau, ¹O Ferrández. ¹Hospital del Mar, Pharmacy, Barcelona, Spain; ²Hospital del Mar, Rheumatology, Barcelona, Spain

10.1136/ejhp-2019-eahpconf.503

Background Drug injection-related pain is associated with a poor treatment adherence.

To reduce it, a new subcutaneous formulation of adalimumab free of citrate and with a smaller volume injection and calibre needle has been brought to the market.

Purpose The objective was to assess the influence of the treated pathology and associated factors on the pain reduction due to the switch to the new formulation of original adalimumab.

Material and methods Prospective study performed during adalimumab's formulation shift (2017) in the outpatient pharmaceutical care area of a tertiary hospital.

All patients that had received both formulations were included and classified by the treated pathology.

Pain was assessed by the patients through a visual analogue scale (VAS)(0–10 cm).

Data collected: demographic, country of origin, injection site, administration frequency, number of doses before the switch, biologic-naïve, VAS score pre- (VASPRE) and post- (VASPOST) formulation switch, concomitant medication.

Statistics: median and interquartile range for quantitative (except age, mean (SD)), and% for qualitative variables.
